

# Offsites Test Area Project

In addition to the Nevada Test Site, the United States conducted underground nuclear tests at 8 other locations in the continental U.S. As part of “The Offsites Project”, DRI is conducting subsurface flow and transport modeling at test areas in Alaska, Colorado, New Mexico, and Nevada.

The nuclear tests at the Offsites were conducted for the weapons program, detection and monitoring of seismic events (Vela Uniform Program), and the development of nuclear devices for peaceful applications (Plowshare Program).
